3.3 Additional information

The national common bird monitoring scheme (MMM) has been running since 1999, and there is no population trend data from before. There is not enough information on the long-term trend of this species to make even an expert estimate. The short-term trend was increasing (15-115%) according to the MMM database, but at least the upper range of this trend seems unrealistically high and is not consistent with the population estimate in MME Nomenclator Bizottság (2008) or the 2013 report.
