### 3.3 Additional information

The national common bird monitoring scheme (MMM) has been running since 1999. There is no population trend data from before. For the minimum value, the minimum decrease calculated from the MMM for the 1999-2018 period has been used here, assuming that the population was stable before. The maximum value was calculated by using the rate of annual decline determined for the 1999-2018 period (-3.7%) and projecting it for the 1980-2018 period, assuming that this rate was valid also in the 1980-1999 period. The trend may have been different before 1999. but the intensification of agriculture, the main threat to the species, was also dominant in this period, so it can be assumed that indeed a decline took place.
